In this project, we were to create a tutoring website that teachers, faculty, admins, and students can use.

 I was in charge of:
- Creating the login page for the admin/faculty/teacher
- Create new login accounts on database according to specifications
- Correspond teacher's documents to students enrolled in their class
- Correspond students to their enrolled courses

 I used PHP, SQL, Javascript, HTML, and CSS to construct the website. We also used Angular and Bootstrap.

Some of the functionality may not work due to site no longer being live on my edu server. I am currently looking for options to create a live version.
